

ABSTRACT OF THE DISCLOSURE

An apparatus and method for storing slides in an angular, offset or fanning arrangement. The apparatus includes a base member and two support members. At least one of the base member, 5 the first support member, and the second support member is arranged at an angle. With this configuration, the plurality of slides are angularly stacked on the base member and between the first and second support members. A bottom slide of the plurality of slides is dispensed through a slot defined between 10 one of the lateral support members and the base member. The fanning arrangement can be a vertical fanning arrangement, a horizontal fanning arrangement, or a combination thereof.
